Core monitoring techniques and  
experimental validation and demonstration

## Summary of the validation exercise for AKR-2

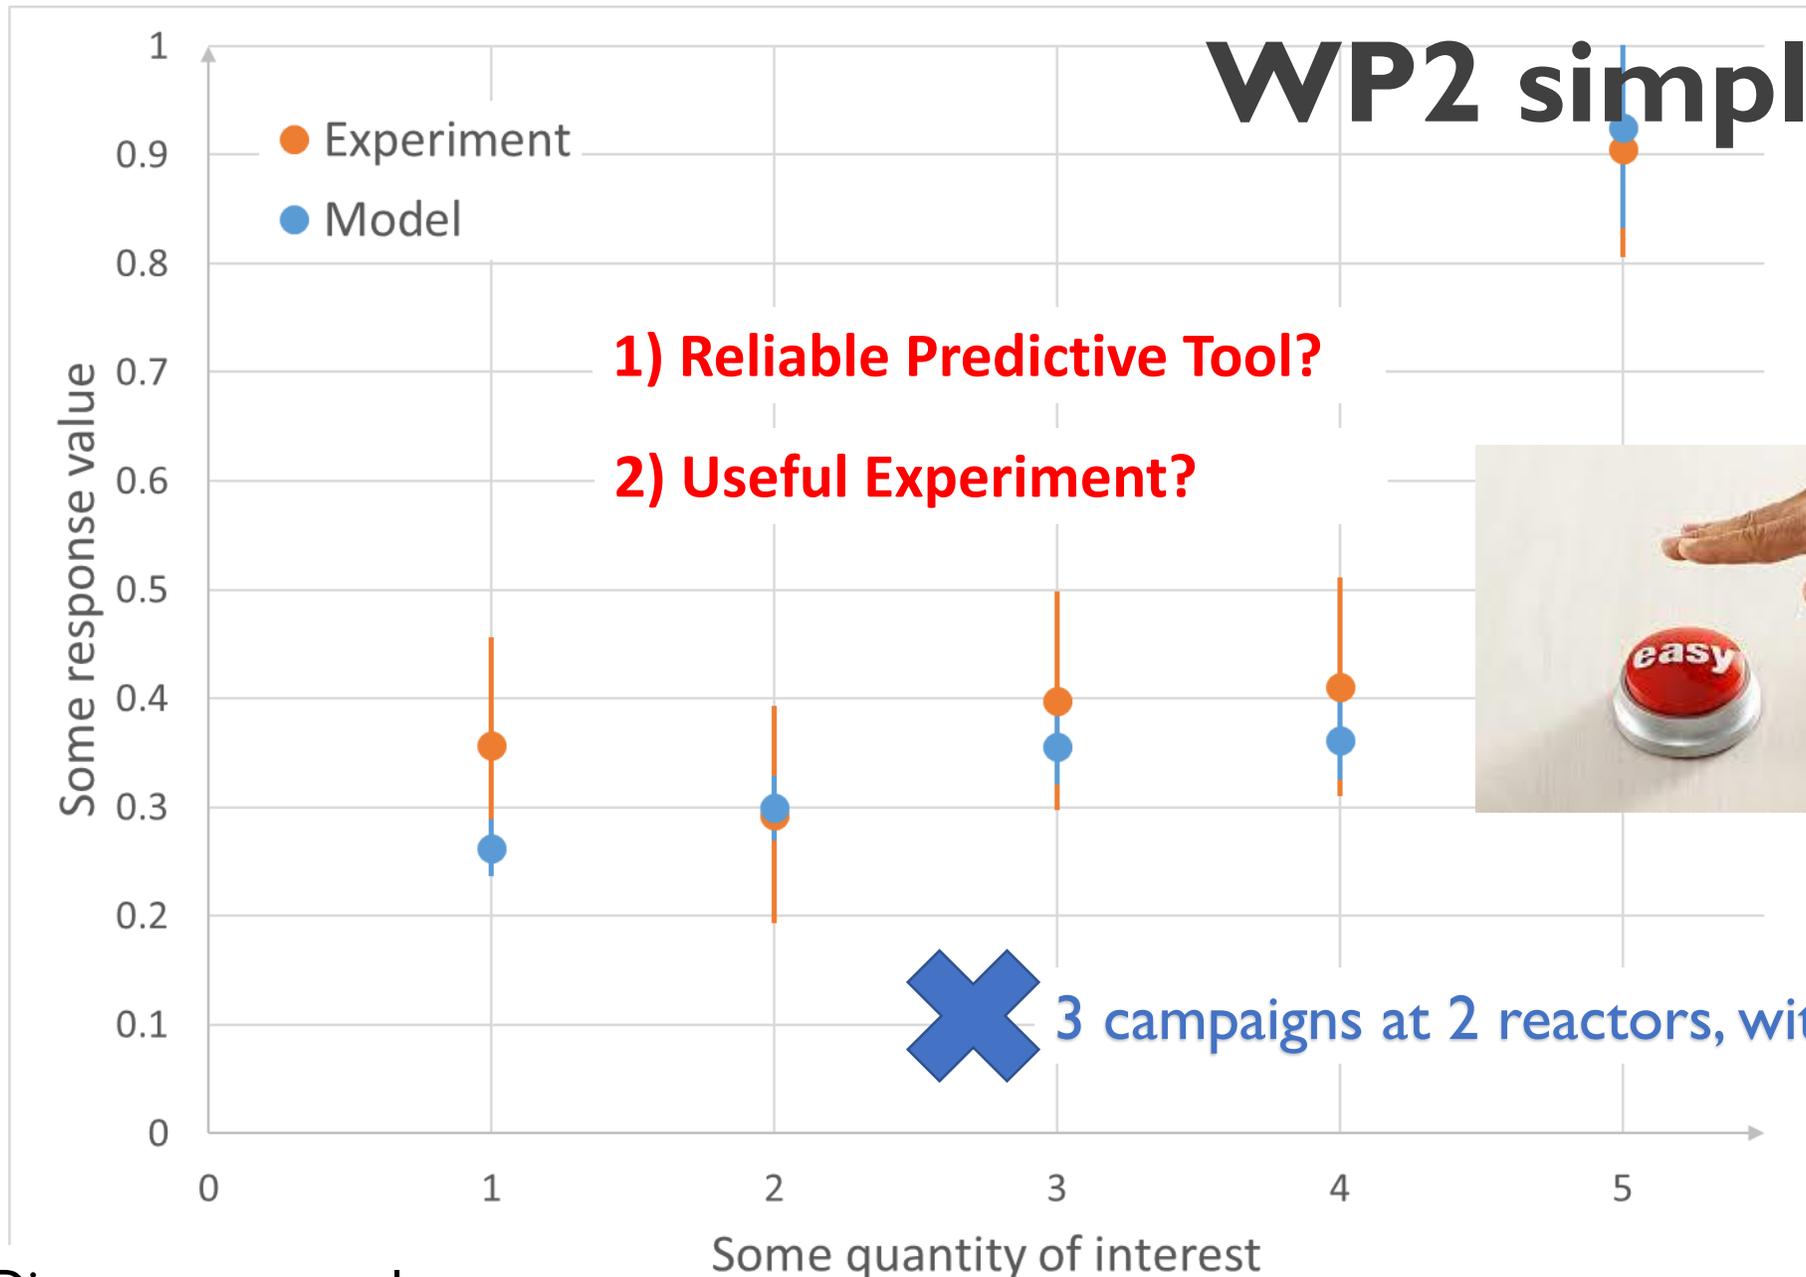

**Validation workshop, 23-24 March 2021**

**On behalf of all partners involved in WP2**

This project has received funding from the Euratom research and training programme 2014-2018 under grant agreement No 754316.

# WP2 simple life

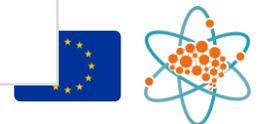

1) Reliable Predictive Tool?

2) Useful Experiment?

3 campaigns at 2 reactors, with 7 models

Gantt Diagram, one year later

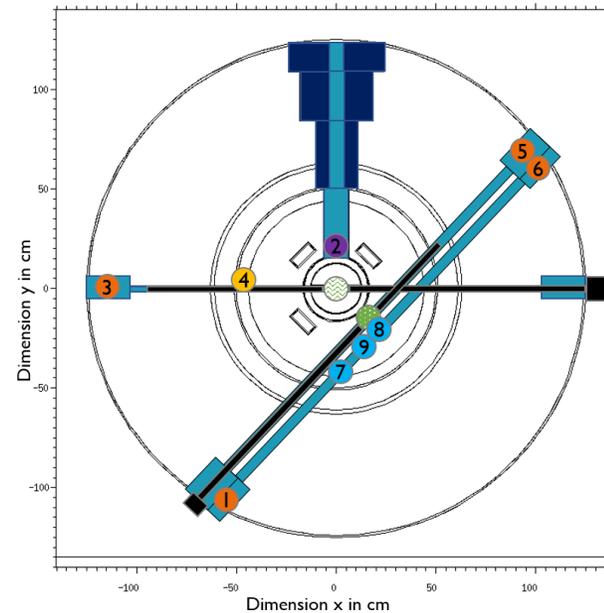

# Outline

- Spatial variation of the relative noise levels in AKR-2
- Overview of the code-to-code comparison for the AKR-2 model
- Overview of the code-to-experiment comparison
- What did we learn?

# Codes, QoI, Experimental data

- Computational results of Chalmers (CORESIM+), Kyoto University (MCNP)
- Experimental results for the 2<sup>nd</sup> campaign (EXP)
- Focus on the relative noise amplitude at the fundamental frequency and detector location
- $PSD_{ref}$  is at the detector 8 location

- Accessible experimental channel
- Location of perturbation
- Rotating device
- Linear motor axis
- Tall fission chamber
- Small fission chamber
- He-3 counter
- Fibers
- PE- elements
- Regions blocked with the mechanical parts of the perturbation devices

Power ratio:  $R_i = \frac{PSD_i}{PSD_{ref}}$

# Measurements of the 2<sup>nd</sup> campaign at AKR-2

	Device	Frequency in Hz	Position of VA wrt center in cm	Amplitude in cm
1	AVS	2		
2	AVS	2		
3	AVS	0.1		
4	AVS	0.1		
5	AVS	4		
6	AVS	4		
7	AVS	1		
8	AVS	2		
9	VA	2	4	0.5
10	VA	0.1	4	0.5
11	VA	7	4.5	1
12	VA	0.01	4.5	0.5
13	VA	0.01	4.5	0.5
14	AVS	2		
15	VA	0.01	0	2
16	VA	0.01	0	2
17	VA	1	0	2
18	VA	1	0	2
19	VA	4	5.5	3
20	VA	2	5.5	3
21	AVS	2		
22	VA	2	5.5	3
23	Both	2	4	0.5

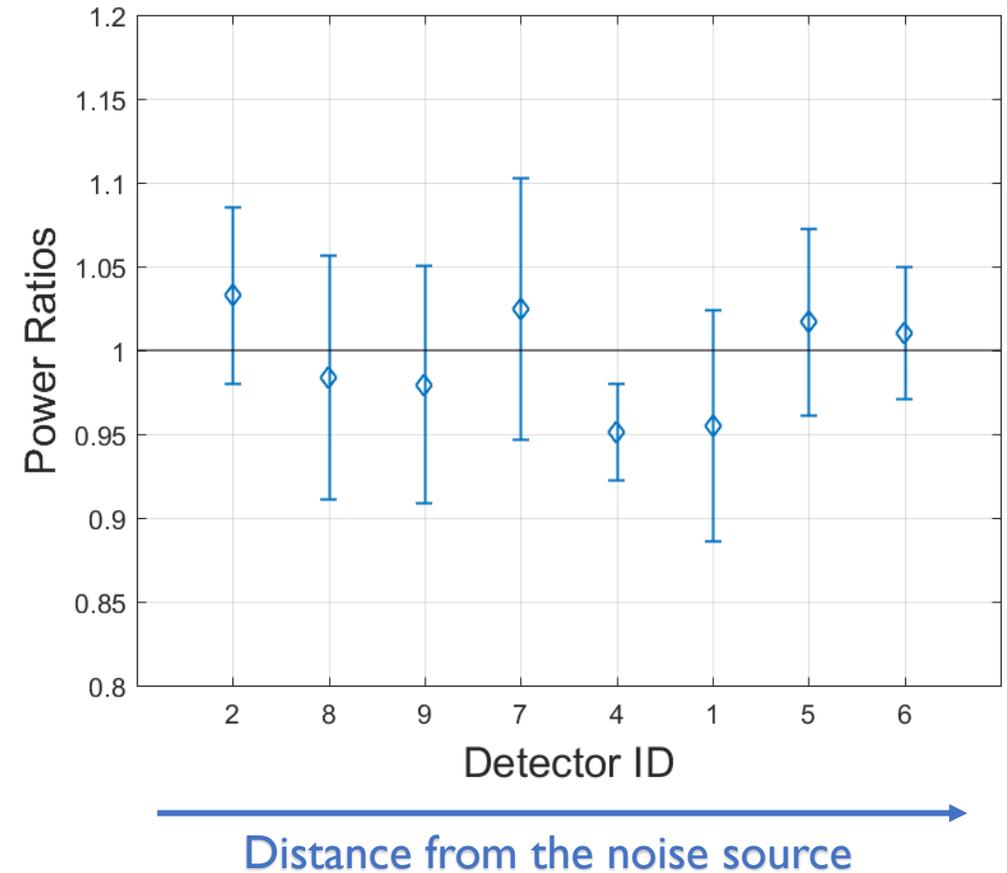

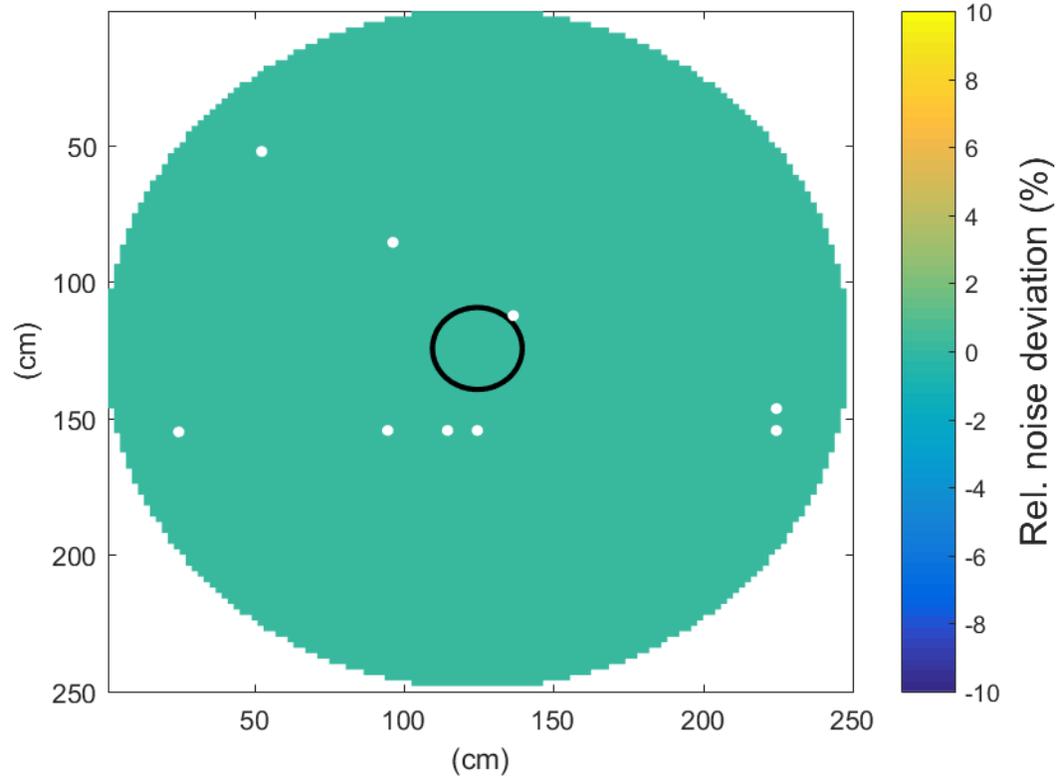

Do not use

Handle with care

Reliable

AVS: absorber of variable str.  
 VA: vibrating absorber

# The perfect point reactor

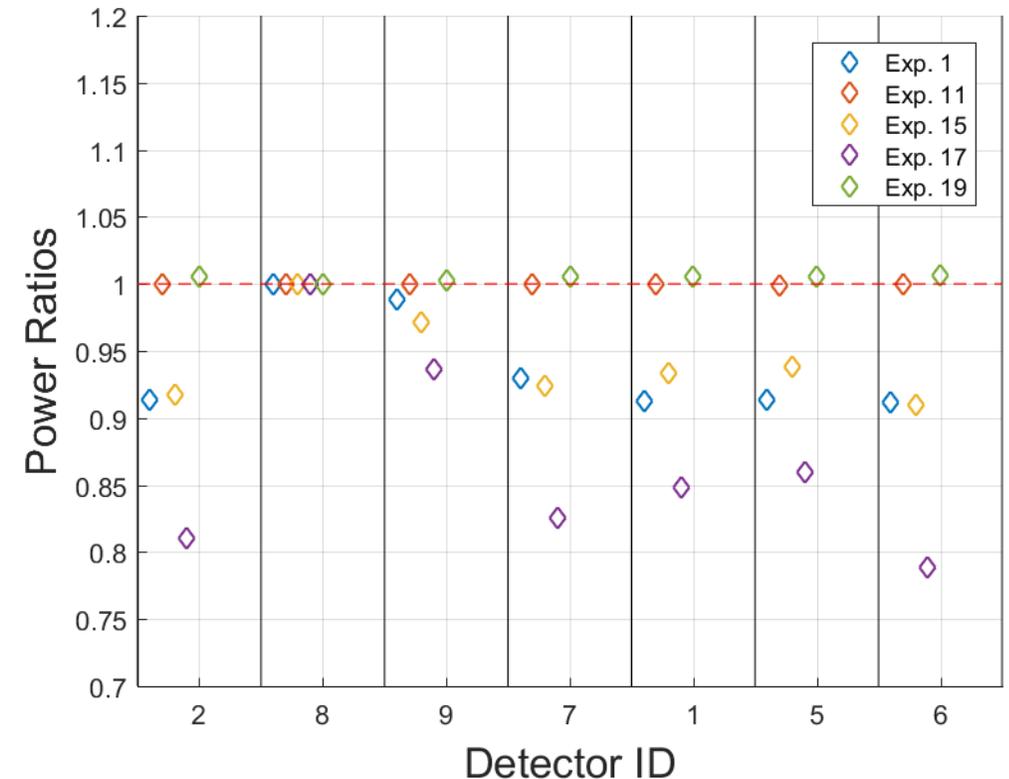

We are interested in significant deviations from 1; the larger the better

# Spatial variation of the noise

- CORESIM+ calculations
- Spatial variations are dependent of experimental parameters
- At the detector locations, Exp 1 (AvS) and 17 (centered VA) should allow seeing largest spatial effect
  - Centered VAs are best
  - Larger frequencies increase this effect
  - Largest deviation ~ 20%

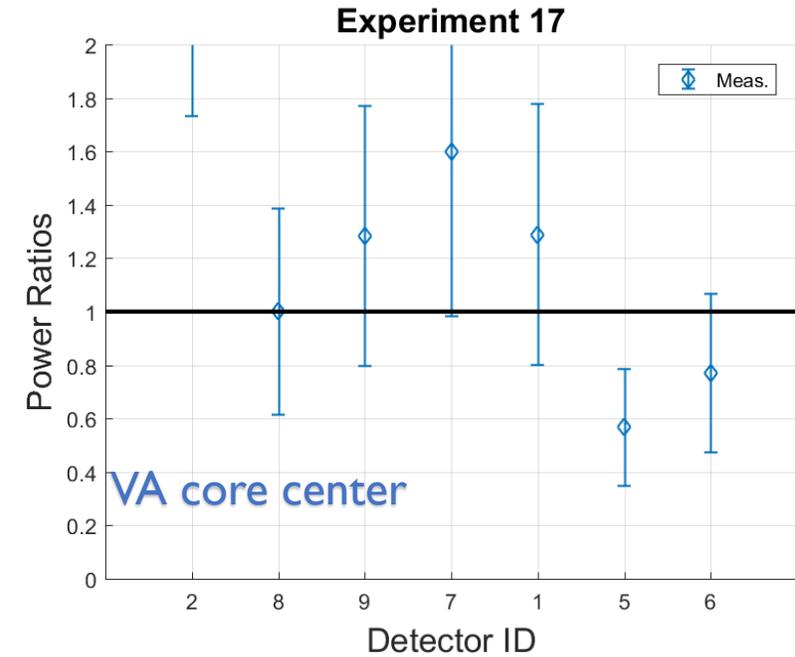

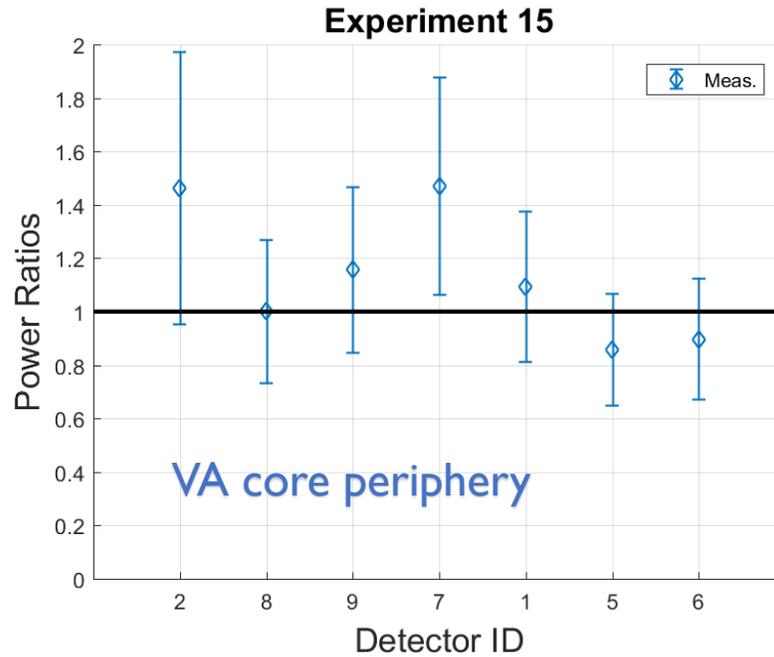

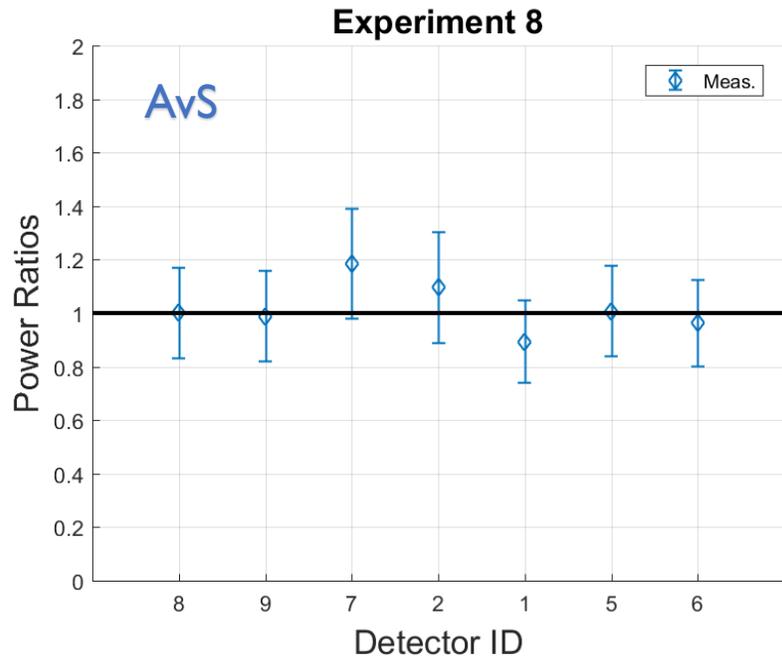

Experiment No	Type	Frequency in Hz	Motion parameters in cm	
			centre	amplitude
1/8/14/21	AVS	2		
11	VA	7	4.5	1
15	VA	0.01	0	2
17	VA	1	0	2
19	VA	4	5.5	3

Distance from the noise source

# Typical experimental uncertainties

Distance from the noise source

Distance from the noise source

Distance from the noise source

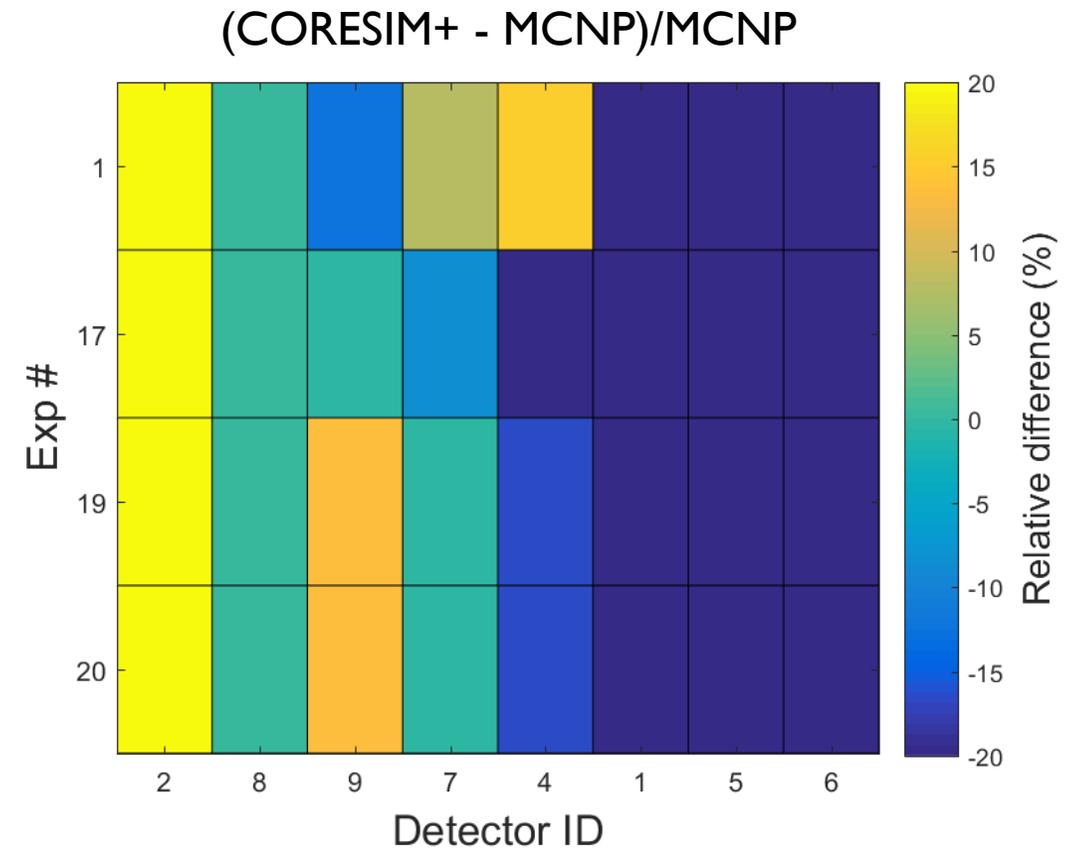

Exp. data does not allow “seeing” deviations from PK behavior

# Code-to-code comparison

- **Overlapping set is composed of exp. 1 (AVS) and 17 19 20 (VA)**
  - 19 and 20 should provide similar outcomes (VA at different frequencies)
- **Detector responses are the thermal flux at the detector location (CORESIM+) or the reaction rates at the detector location (MCNP)**

Experiment No	Type	Frequency in Hz	Motion parameters in cm	
			centre	amplitude
1	AVS	2		
17	VA	1	0	2
19	VA	4	4.5	3
20	VA	2	4.5	3

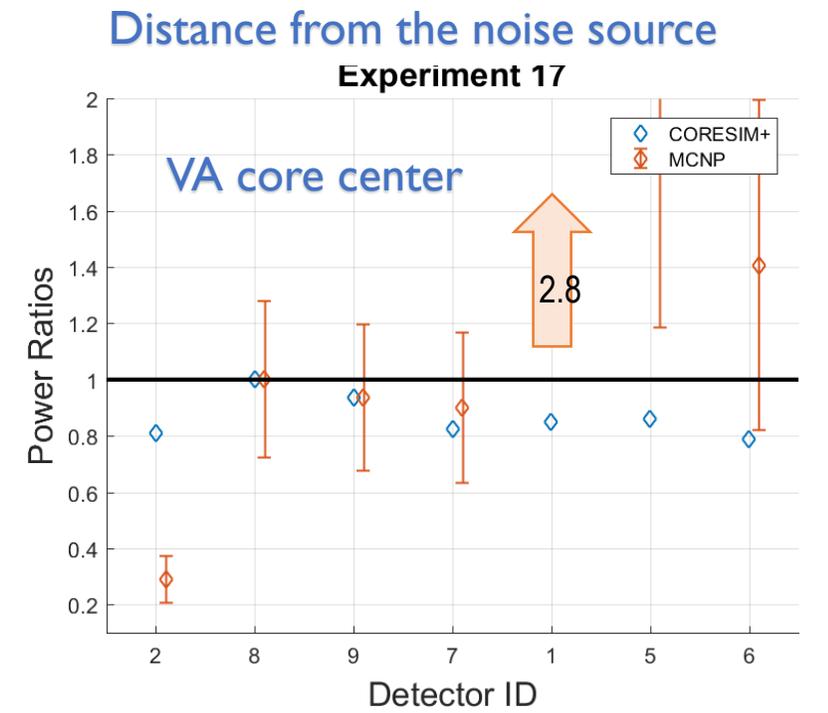

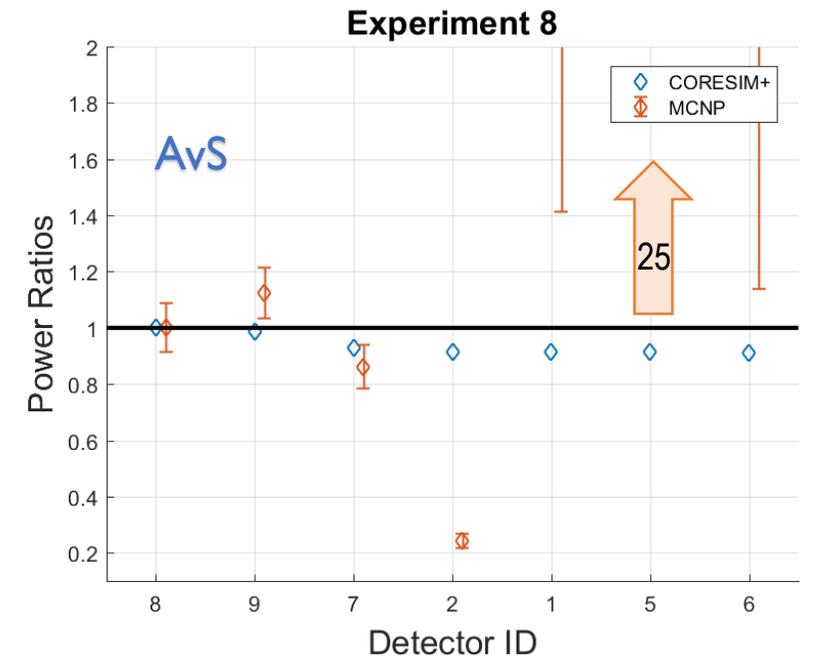

Distance from the noise source

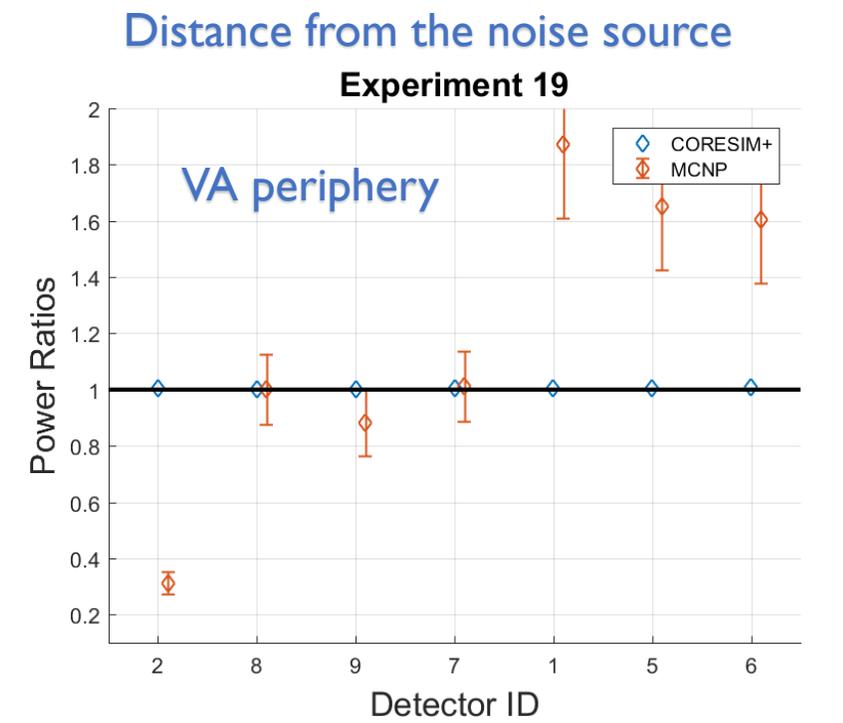

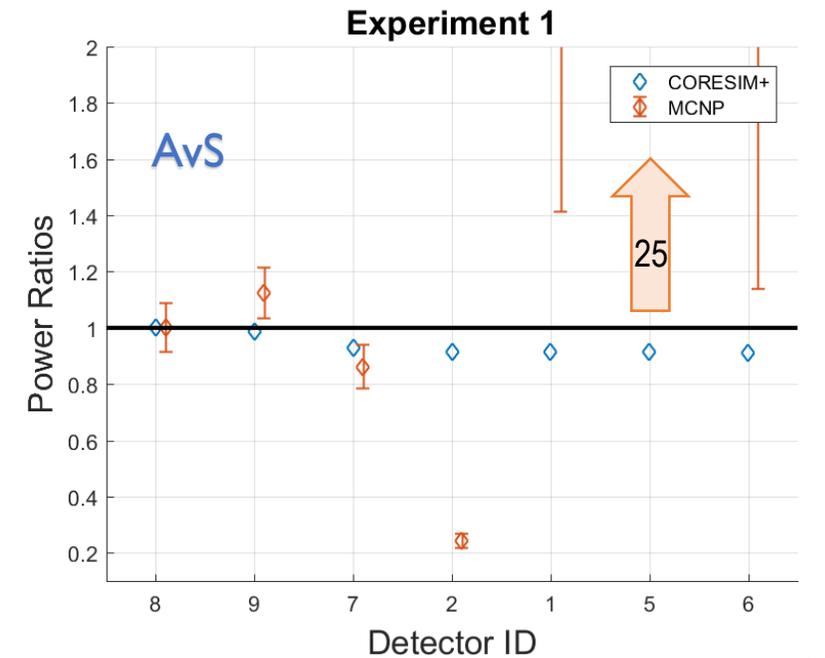

# Code-to-code comparison

- **Statistically significant differences for Detector #2**
- **Detectors away from the core center are widely different**
  - **Noise levels are consistently larger for 1 5 & 6 for MCNP but MC uncertainties are also very large**

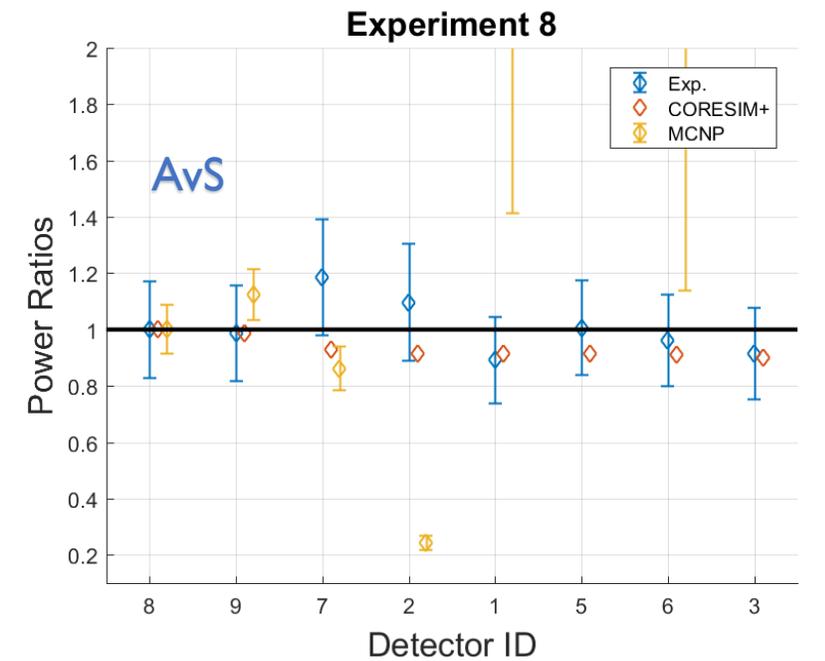

# Code-to-code comparison

- **Statistically significant differences for Detector #2**
- **Detectors away from the core center are widely different**
  - Noise levels are consistently larger for 1 5 & 6 for MCNP but MC uncertainties are also very large
- **MCNP does not confirm spatial trends of CORESIM+ close to the core (detectors 7,8 & 9)**
  - MC uncertainties are too large
  - Even for VA in the core periphery

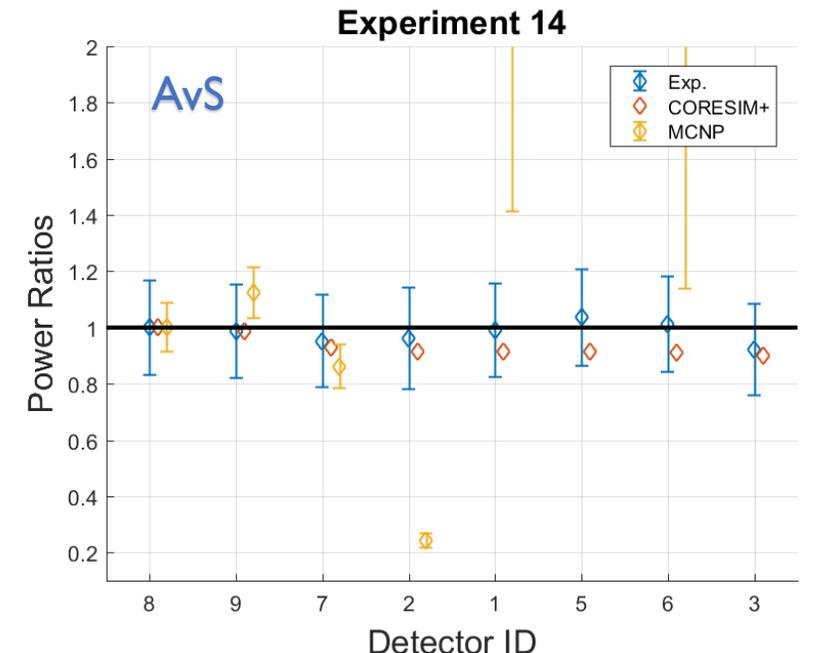

# Comparison to experimental data (AvS)

- Magnitude of the computational uncertainties  $< 1\%$
- **CORESIM+** results are consistent with experimental results for det #2; and far from the noise source (1,5 & 6)

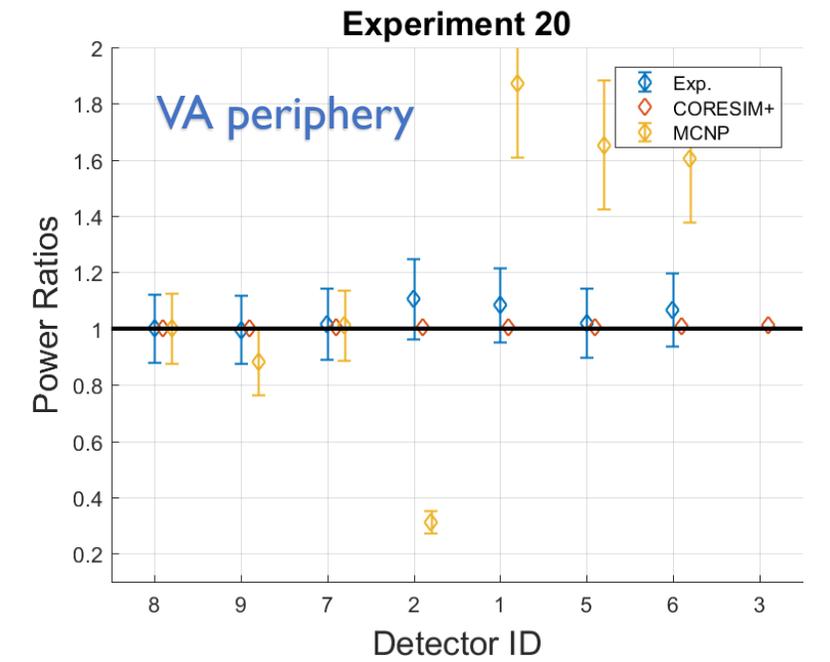

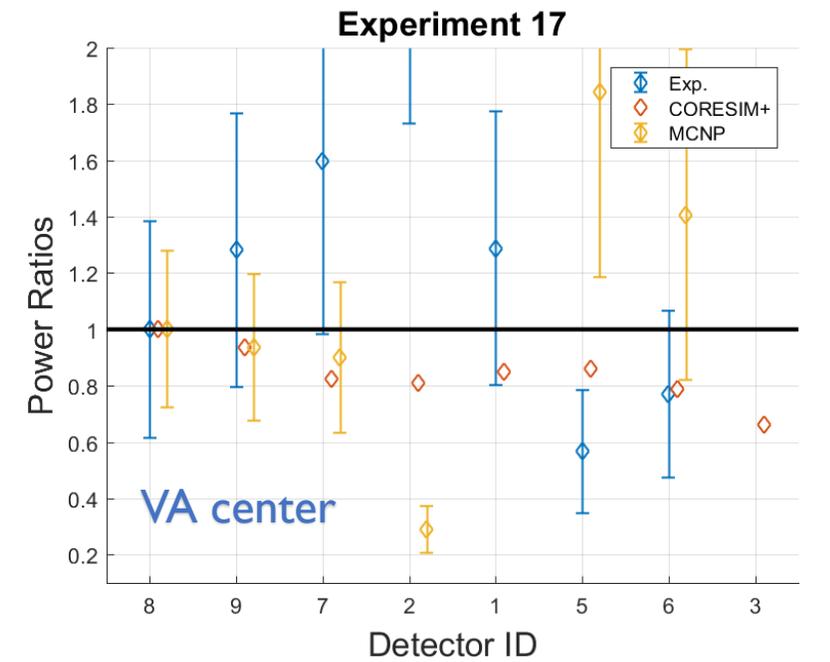

Distance from the noise source

# Comparison to experimental data (VA)

- Magnitude of the computational uncertainties  $< 1\%$
- **CORESIM+** results are consistent with experimental results for det #2; and far from the noise source (1,5 & 6)

# Conclusions

- AKR-2 is difficult to model for both deterministic and stochastic codes
- Power ratios are difficult to measure with sufficiently small uncertainties
  - No spatial behavior of the noise could be experimentally observed yet
  - Configurations allowing largest deviation from PK behavior identified
- Computational trends/issues have been identified with MCNP models
  - MC uncertainties are difficult to reduce even close to the core
  - Modeling of detector #2
  - Behavior at large distances
- CORESIM+ appears reliable at least in terms of trends; it is not crazy to use it within ML algorithm

# Thank you
